TCHUKI.COM

Corporate Website Build Prompt

Parent brand	TCHUKI
Current businesses	Tchuki Farms • Tchuki Media House / Tchuki Digital
Domain	tchuki.com
Purpose	One unified corporate website for the current group and future businesses.

Growing Ideas. Building Businesses. Creating Impact.

Prepared as a practical prompt to build the public website, individual business pages, content management dashboard, secure database, and deployment setup.

1. Project Overview

Build a premium, modern, fully responsive corporate website for TCHUKI, a parent brand representing a growing group of businesses.

- Official domain: tchuki.com.
- Primary market: Malawi, with the ability to serve clients and partners internationally.
- Main brand name: TCHUKI.
- Proposed corporate slogan: Growing Ideas. Building Businesses. Creating Impact.
- The website must bring together the group's current businesses under one unified corporate identity without removing their individual identities.
- Current businesses: Tchuki Farms; Tchuki Media House / Tchuki Digital.
- Design the architecture so new businesses can be added through an administration dashboard without rebuilding the website.
- Do not invent businesses, achievements, clients, financial figures, certifications, or legal claims. Mark unconfirmed ventures as forthcoming.

2. Brand Positioning

Position TCHUKI as a diversified, forward-looking business group committed to entrepreneurship, innovation, agricultural development, technology, and practical solutions.

- Communicate professionalism, innovation, growth, opportunity, and collaboration.
- Use “Tchuki Group” as a corporate brand presentation; do not claim a specific registered holding-company structure unless confirmed.
- Tchuki Farms slogan: “Growing Agriculture, Empowering Farmers.”
- Tchuki Digital slogan: “We Build Your Future. Deploy Your Imagination.”

3. Visual Design System

- Use deep forest green, white or warm off-white, charcoal or dark navy, and restrained gold accents.
- Use authentic high-quality photography, modern typography, generous spacing, elegant cards, and subtle transitions.
- Ensure a polished experience on desktop, tablet, and mobile.
- Avoid clutter, excessive gradients, excessive animations, and cartoon-style graphics.
- Use the owner's official Tchuki logo when supplied. Never invent or substitute an official logo; use a temporary text wordmark if the logo is unavailable.

4. Website Navigation

Create a responsive navigation bar with Home, About Tchuki, Our Businesses, Products & Services, Projects, News & Insights, Partnerships, and Contact. Include a prominent “Work With Us” or “Start a Conversation” call to action. Keep navigation accessible on mobile and consistent across all pages.

5. Homepage

A. Hero

- Headline: “Growing Ideas. Building Businesses. Creating Impact.”
- Supporting text: “Tchuki brings together agriculture, technology and creative solutions to help businesses grow, empower communities and turn opportunities into practical results.”
- Primary CTA: Explore Our Businesses. Secondary CTA: Partner With Tchuki.
- Use a visual composition representing agriculture, digital innovation, and business growth.

B. Introduction

- Heading: “One Vision. Multiple Opportunities.”
- Explain that Tchuki brings together complementary business ventures under one recognizable brand, each focused on practical value in its industry.
- Include a short introduction, image, and link to About.

C. Our Businesses

- Display dynamic business cards sourced from database records.
- Tchuki Farms: agricultural inputs, BioKash Organic Fertilizer, seedlings, farmer education, advisory, training, and smart farming. CTA: Explore Tchuki Farms.
- Tchuki Media House / Tchuki Digital: custom software, business systems, websites, mobile apps, AI, graphic design, branding, and digital marketing. CTA: Explore Tchuki Digital.
- Each card needs an appropriate image, concise description, service highlights, and dedicated business page.

D. Areas of Impact

- Show agriculture and farmer empowerment, technology and digital transformation, business solutions and entrepreneurship, and creative communication and marketing where supported by active businesses.
- Allow categories to be managed from the admin dashboard.

E. Why Tchuki?

- Highlight a unified brand with diverse capabilities, practical solutions, innovation, customer-focused service, collaboration, and commitment to growth.
- Present these as brand commitments, not unsupported claims of market leadership or proven results.

F. Featured Projects

- Support project name, related business, category, description, cover image, optional gallery, project status, and external link.
- Do not create fictional completed projects. Use an elegant empty state or approved projects.

G. News & Insights

- Support company announcements, agricultural education, technology articles, business advice, product announcements, and project updates.
- Provide article pages, categories, cover images, publication dates, and sharing metadata.

H. Partnership CTA

- Headline: “Let's Build Something That Matters.”
- Invite customers, business owners, suppliers, and potential partners to discuss opportunities.
- Buttons: Contact Tchuki and Explore Partnership Opportunities. Do not claim investment products are available unless confirmed.

I. Footer

- Include TCHUKI identity, corporate description, navigation, business links, contact information, configured social links, privacy policy, terms, and current-year copyright.
- Verified contact: +265 986 611 989; tchukimediahouse@gmail.com.
- Do not invent social handles, physical addresses, or other contact details.

6. Individual Business Pages

Create dynamic profile pages using a reusable template. Each page should include the business name and approved logo, hero image, introduction, overview, available vision/mission/values, products and services, projects, image gallery, news, FAQs, inquiry form, WhatsApp action, and SEO metadata.

Tchuki Farms must feature agricultural inputs, BioKash Organic Fertilizer, seedlings, advisory services, farmer training, and smart farming. Tchuki Digital must feature custom software, business management systems, websites, mobile apps, AI and automation, graphic design, branding, and digital marketing.

Allow each business its own brand colors, logo, imagery, contact details, and social links while retaining the parent Tchuki identity.

7. Products and Services Directory

- Build a searchable directory with name, description, category, associated business, images, publication status, optional price, and inquiry action.
- Allow filters by business and category.
- Do not require e-commerce checkout in the initial version. Use inquiry-based ordering until payment and fulfillment are confirmed.

8. Contact and Inquiry System

Create a professional contact page and forms with full name, email, phone, optional organization, inquiry type, business of interest, and message.

- Inquiry types: general, product, software development, agricultural services, marketing, partnerships, and other.
- Validate fields; store submissions securely; provide clear success and error messages.
- Include spam protection, server-side validation, and suitable privacy/consent notices.
- Allow authorized administrators to review, categorize, and update inquiry status.
- Support notifications to a configured business email once email delivery is configured.
- Never expose secret API keys or privileged database credentials in frontend code.

9. Secure Administration Dashboard

Create a protected /admin dashboard for authorized administrators to manage the site without editing source code.

- Modules: overview, businesses, products and services, projects, articles, media library, inquiries, navigation/footer, SEO/site settings, and administrator accounts.
- Allow adding, editing, ordering, publishing, unpublishing, archiving, and previewing business records.
- Support business logo and cover-image uploads, business categories, descriptions, services, and contact details.
- Provide rich-text editing, image uploads, draft/published states, publication dates, and previews.
- Suggested roles: Super Administrator, Content Administrator, and Business Editor.
- Enforce authorization server-side and through database policies; do not merely hide buttons.
- Never hardcode production admin passwords or expose administrator records publicly.

10. Database and Backend

Use Supabase for PostgreSQL, authentication, and storage unless the project already has a compatible backend. Implement migrations and document setup.

Table	Suggested fields
businesses	id, name, slug, short_description, full_description, logo_url, cover_image_url, brand_color, category, email, phone, website_url, social_links (JSONB), display_order, status, created_at, updated_at
business_services	id, business_id, name, slug, description, image_url, status, display_order, created_at, updated_at
products	id, business_id, name, slug, description, category, image_urls, nullable price, currency, availability_status, publication_status, created_at, updated_at
projects	id, business_id, title, slug, description, cover_image_url, gallery_urls, project_status, external_url, publication_status, created_at, updated_at
articles	id, nullable business_id, title, slug, excerpt, content, cover_image_url, category, author_id, publication_status, published_at, created_at, updated_at
inquiries	id, full_name, email, phone, organization, inquiry_type, nullable business_id, message, status, created_at, updated_at
site_settings	id, setting_key, setting_value, updated_at
profiles	authentication user id, full_name, role, nullable business_id, created_at, updated_at

- Add foreign keys, indexes, unique constraints, timestamps, and validation.
- Apply Row Level Security to relevant tables. Public visitors may read published content and submit permitted inquiries only.
- Private inquiries and administrator profiles must never be publicly readable.
- Only authorized users may modify content.

11. Image Storage

- Configure storage for business logos, cover images, product images, project galleries, and article images.
- Use clear folder structures by content type and business identifier.
- Support image preview, file type/size validation, upload progress, error feedback, and replacement.
- Store actual storage URLs, not local computer file paths.
- Allow authorized administrators to upload/manage media; expose only intended public assets.

12. SEO, Accessibility, and Performance

- Add descriptive titles and meta descriptions, canonical URLs, Open Graph metadata, XML sitemap, and robots.txt.
- Use structured data appropriate to verified business information.
- Use semantic HTML, accessible navigation, optimized images, responsive layouts, and lazy loading where suitable.
- Create a custom 404 page and clear internal links.
- Use clean URLs: /about, /businesses, /businesses/tchuki-farms, /businesses/tchuki-digital, /services, /projects, /insights, and /contact.
- Ensure dynamic business and article pages generate correct metadata.

13. Technology and Deployment

- Reuse the existing compatible framework and dependencies where practical. For a new project, use React, TypeScript, a suitable modern styling system, and Supabase.
- Deploy to Netlify and configure tchuki.com as the custom domain.
- Verify the actual build command and publish directory instead of assuming a folder.

- Configure HTTPS, routing or server rendering as required, production environment variables, database migrations, and storage policies.
- Keep secrets in server-side environment variables.
- Provide a README covering setup, development, deployment, and maintenance.

14. Final Quality Assurance

- Test navigation and responsive layouts on desktop and mobile.
- Verify both existing businesses and their dedicated profile pages.
- Verify an administrator can add a new business without code changes.
- Test database content, image uploads, contact forms, inquiry storage, authentication, and role permissions.
- Verify published/unpublished content behavior and the custom 404 page.
- Check SEO metadata, social previews, broken links, missing assets, and production errors.
- Confirm no secrets are exposed in frontend bundles and no fictional claims appear.

Final Instruction to Lovable

Build the actual working website, not just a visual mockup. First inspect the existing project and its configuration, then implement the design, database, backend, responsive pages, content management, and deployment in manageable stages. Prioritize the polished public corporate website, then the secure administration dashboard and dynamic content management. The finished result must present TCHUKI as one unified, ambitious brand with multiple business ventures and room for future expansion.
